

Denver Gold Group Tom Brady, Chief Economist January 2015

Agenda

- Brief Introduction and Newmont Overview
- U.S. & Global Macroeconomic Trends
- Commodity Review
 - Gold
 - Copper
 - Oil
- China & Commodities
- Status of the Commodities Cycle

Tom Brady: brief background

- 1996 PhD in Mineral Economics from CSM
- JPM Commodity Research Desk
- 1996 1998: Mining
 - Newmont Mining Corporate Development analyst
- 1998 2007: Energy / Oil & Gas
 - Risk Capital Advisors
 - Arthur Andersen
- 2007 Present: Mining
 - Newmont Mining
 - Treasury: Financial Risk Management
 - Investor Relations
 - Strategic Planning
 - Chief Economist

About Newmont

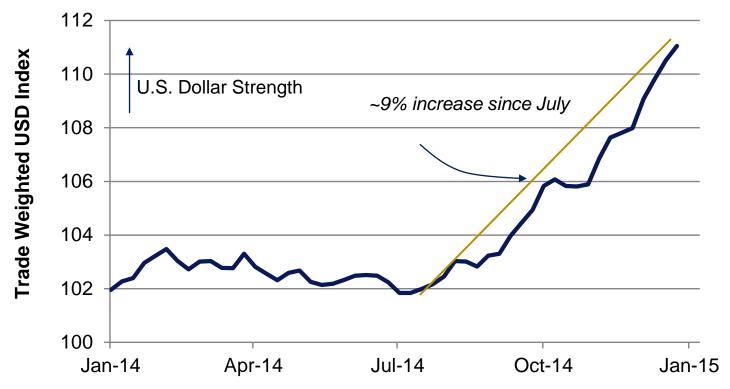

- Founded in 1921
- Second largest gold mining company by production
- ~ 30,000 employees and contractors (was ~ 45,000)
- Only gold mining company included in the S&P 500 Index and Fortune 500
- BBB rating from Standard & Poor's;
 Baa2 rating from Moody's
- Publically traded on the New York Stock Exchange since 1940 - NYSE: NEM
- Market Capitalization: ~\$9.7B

Gold pour at Gold Quarry, Nevada

U.S. dollar strengthening

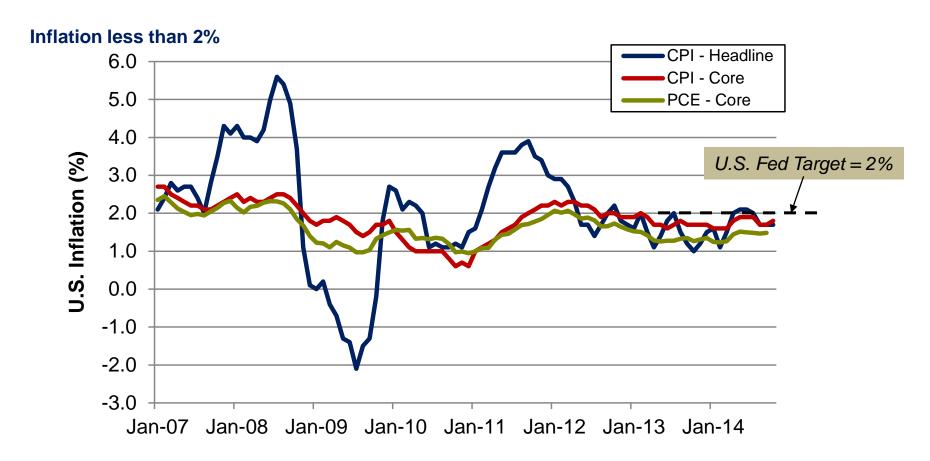

Recent U.S. dollar appreciation expected to continue*

- U.S. dollar has strengthened on improved outlook for economic conditions
 - Trade-weighted index up ~9% since July
- Market expects the U.S. dollar index to gain another ~3% in 2015
 - Gold is priced in U.S. dollars and becomes relatively more expensive with dollar strengthening

^{*} Fed Reserve Broad (Trade-weighted) dollar index: currencies weighted based on international trade (China: 20%, Euro Area: ~17%, Canada: 13%, Mexico: 11%, Japan: 7%, UK: ~3%, South Korea: ~4%, Brazil: 2%, Others: 23%)

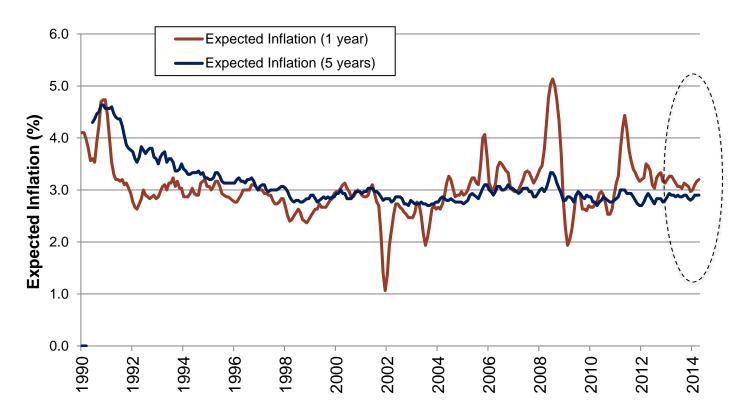

Inflation has remained low by multiple measures

- Multiple measures of US inflation remain below Fed's target of 2%
 - Headline CPI (most often quoted): currently ~1.7%
 - Core CPI (excludes volatile food & energy costs): currently ~1.8%
 - Personal consumption expenditure (monitored by Fed): currently ~1.5%

Future inflation also expected to remain low

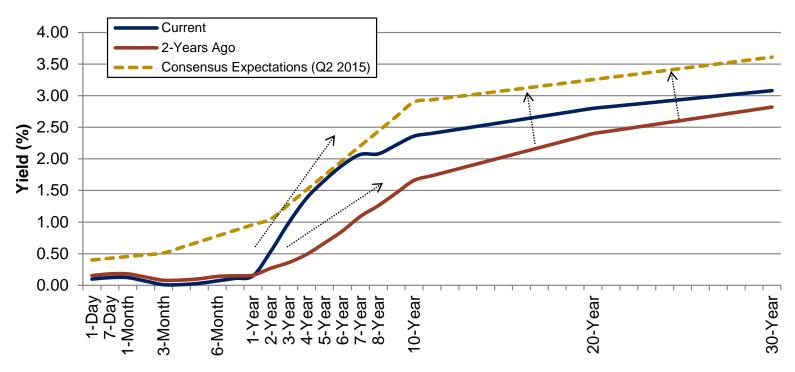

Anticipated inflation to remain muted over the next 1 and 5 years

- Expected inflation from Univ. of Michigan monthly survey
 - Median of monthly survey of ~500 households
- Median expectations are for inflation to remain ~3% over the next 1- and 5-years

U.S. yield curve has steepened and shifted upwards

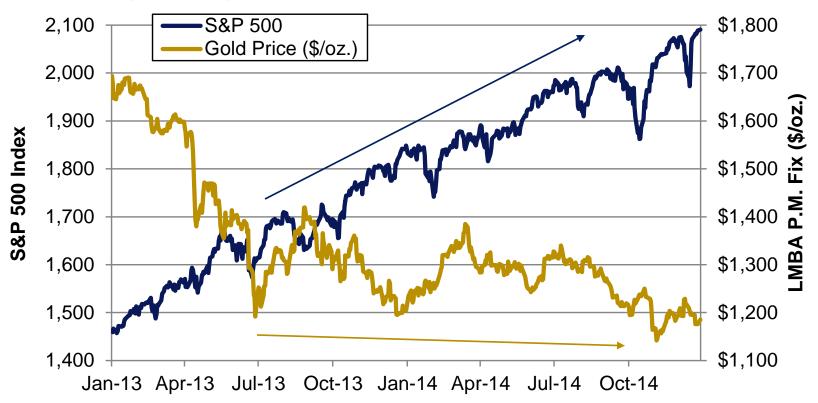

Yield curves past, present & expected

- Over the last 2 years, yields on bonds with maturities > 1-year have increased
 - Lower demand for longer-dated bonds (as U.S. Fed tapers purchases)
 - Results in lower bond prices (and higher yields)
- Yield curve has steepened
 - Signals U.S. economic expansion has gained traction
- Market expects higher rates (near- and medium-term bearish outlook for gold)

U.S. equities and gold prices

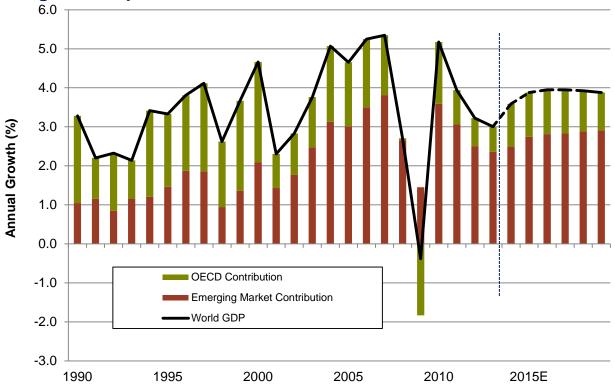

Equities trending up while gold weakens

- Since 1 Jan. 1, 2013: Gold prices <u>down</u> ~\$500/oz. (-30%)
 S&P 500 Index is <u>up</u> over 600 points (over 40%)
- Low inflation and less risk aversion driving investors away from safe-haven instruments such as gold

Global economic growth recovering

Annual global growth expected to increase to 4%

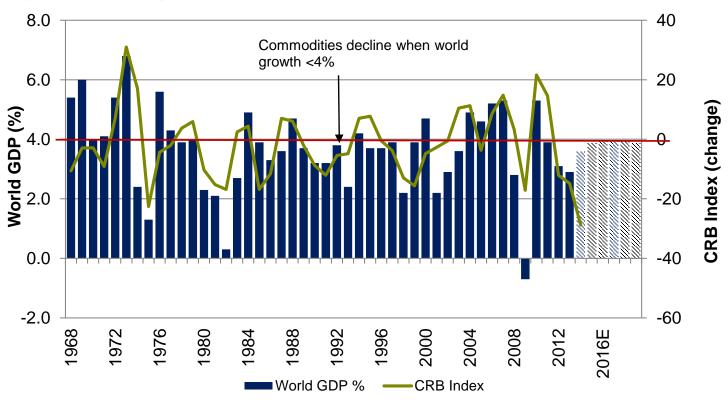

- Prior to 2001, global GDP changes generally based on OECD economic activity
- Post 2001, emerging markets have been primary contributors driving average growth of ~3.5% per year
- Global growth expected to average ~4% through 2019

^{*}Source: IMF WEO Database

Global economic growth and commodities

Slower growth has weighed on the overall commodity sector

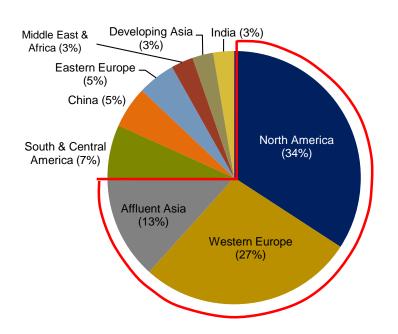

- The CRB index provides a direction of the overall commodity sector
 - Based on futures prices for a basket of 19 commodities
- In general, global economic growth < 4% results in poor performance for a broad collection of commodities

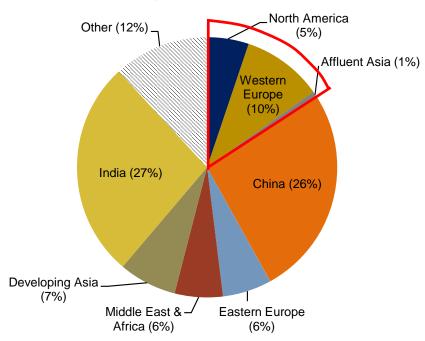

^{*} Source: Dundee Securities

Personal consumption expenditure and gold demand

Global consumer spending

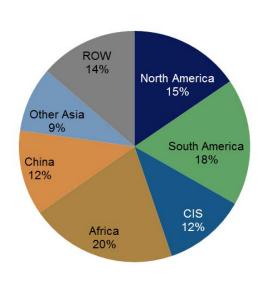

Global consumer gold demand*

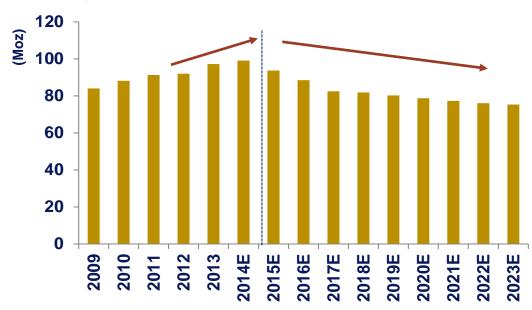

- Global spending was ~\$31 trillion dollars globally in 2012
 - ~75% of total in North America (U.S. and Canada), Western Europe and Affluent Asia (Japan, Australia, South Korea)
 - China and India represent ~5% and 3% of total, respectively
- Over 50% of consumer gold demand in China and India

Strong gold fundamentals support long term pricing

Global gold mine supply (2004 – 2013)

Global gold mine supply projections*

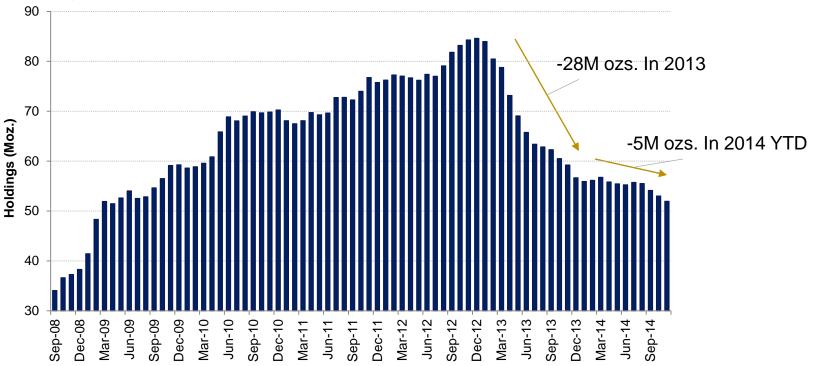

- 60% from emerging countries (vs. 50% 10 years ago)
- Mine supply has grown ~2%/year over the last decade
- Longer-term mine supply growth challenged with fewer new discoveries, capital cost inflation, increasing nationalism and activism, aging mines and declining grades
- Project cancellations and deferments expected to reduce mine supply by ~3%/year going forward

^{*}Source: GFMS and World Gold Council.

Gold ETF liquidations have moderated

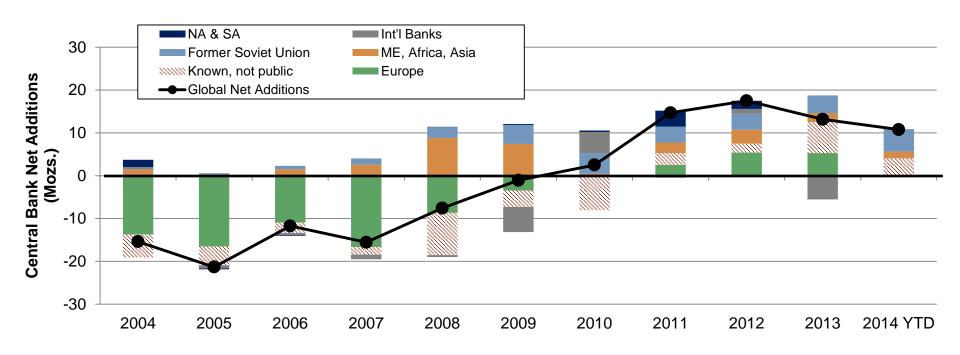

Gold ETF holdings historical trends*

- Global gold ETF volumes decreased over 30 percent in 2013 (~28M ounces)
- Global ETFs currently hold over 20M ounces more than at start of the Financial Crisis

Central banks continue to be gold buyers

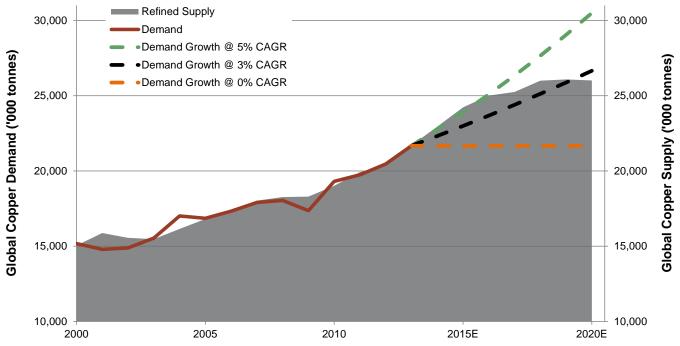

Central bank net-gold additions*

- From 2004 2009, banks were net-sellers of over 70M ounces
- Since 2010 banks have become net gold purchasers
- Gold purchases assist to diversify reserves (primarily away from U.S. and European treasury securities)

Copper surplus limits price upside in near-term

Moderate global surplus conditions expected in over next 2-3 years*

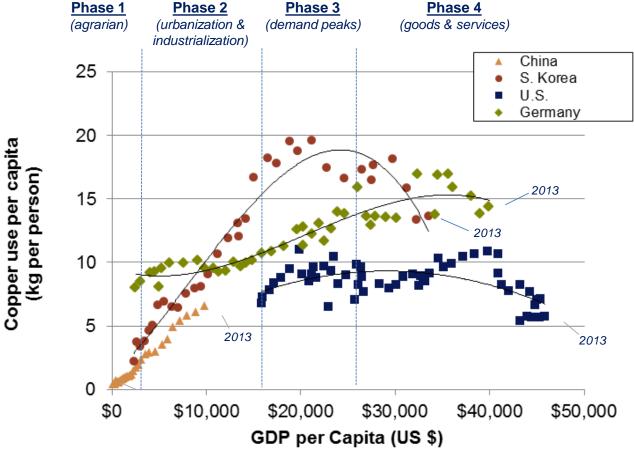

- Global demand has grown ~3.5%/year over last decade
 - Chinese demand growth has exceeded 11%/year
 - Emerging economies accounted for ~70% of total demand in 2013, up from ~45% in 2003
- Refined copper supply expected to grow from <22M tonnes to >26M tonnes by 2020
- Potential global surplus could continue over near-term* except under demand growth assumptions of 5%/year

^{*}These market balance projections include annual supply disruptions of approximately 6 percent over the forecasted period; Source: Wood Mackenzie, Spring 2014

Chinese copper "intensity of use"*

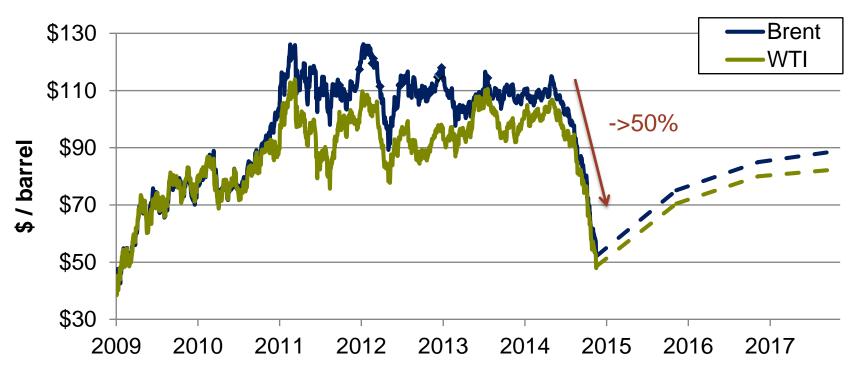

"Intensity of use" suggests increased consumption

- Copper intensity generally first rises, then decreases with increasing per capita income (an inverted "U" relationship)
- In 1990, the average Chinese citizen consumed 0.4kg of copper which has increased to well over 6.0kg last year

WTI and Brent prices and expectations

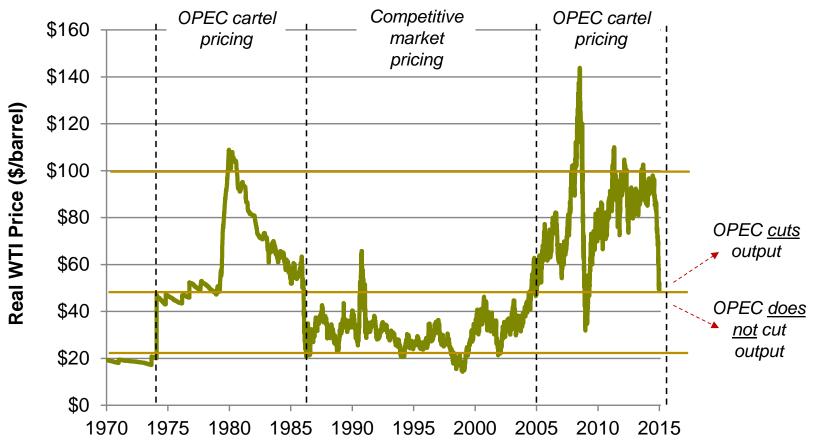

WTI and Brent crude oil prices and median expectations

- Since July 1st WTI prices have dropped ~\$55/barrel (Brent: ~\$60/barrel)
 - Continued growth in U.S. production, slower global growth expectations, higher production within OPEC
- Saudi Arabia desires to maintain market share and achieve geo-political objectives

Competitive markets or monopoly power?

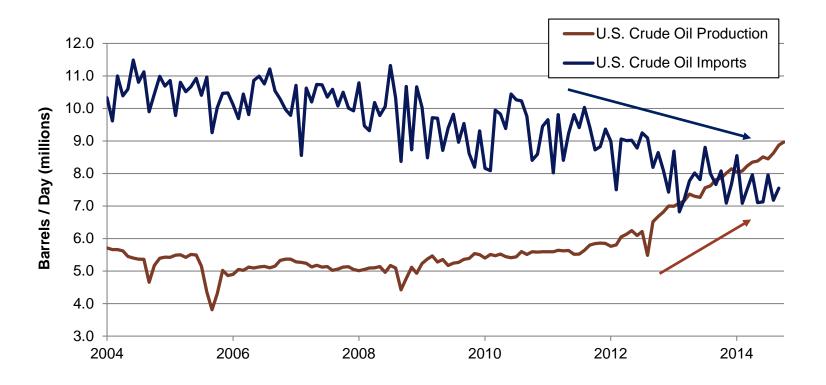

Inflation-adjusted WTI prices

- Oil markets have migrated between periods of competition and where OPEC flexed power
 - Competition: prices heavily influenced by marginal costs within industry
 - OPEC Monopolistic: Saudi Arabia primarily restricting output

Domestic crude oil trends

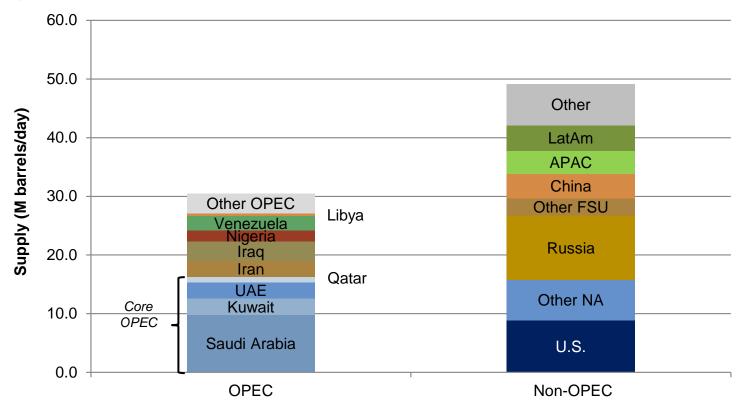

U.S. crude oil production and imports

- The U.S. remains the world's largest oil consumer, accounting for ~20% of global demand
- For each year since 2011, U.S. production has increased ~1M barrels/day
 - U.S. production recently surpassed 9M barrels per day
 - Will this level of growth continue in 2015?

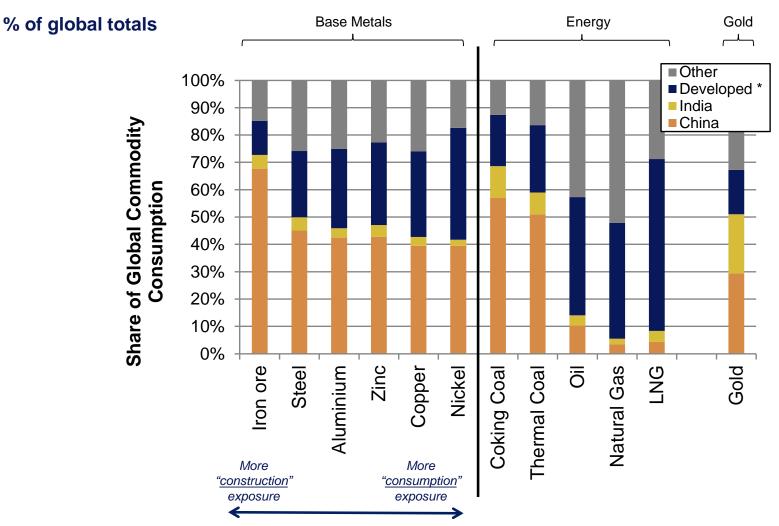

2014E global crude oil supply

2014E global crude oil supply (millions of barrels per day)

- Global crude oil supply nearly 80M barrels/day in 2014
 - ~16M from core-OPEC (~20% of total)
- OPEC production cuts expected to be modest until there is sufficient evidence of a slowdown in the production growth rate in the U.S.

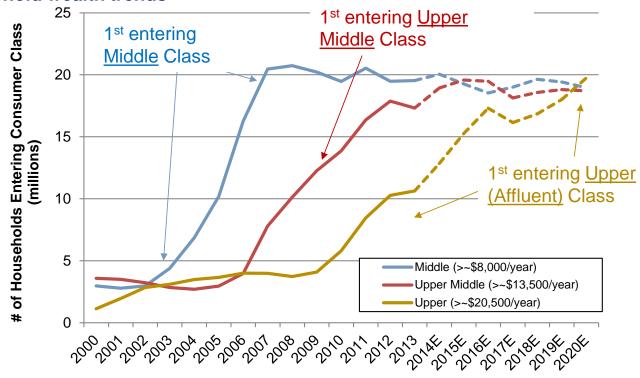

China remains a key driver of commodity demand

 China consumes between 40% - 60% of mined commodities but only generates ~13% of global GDP

As household income rises, consumption mix changes

Chinese household wealth trends

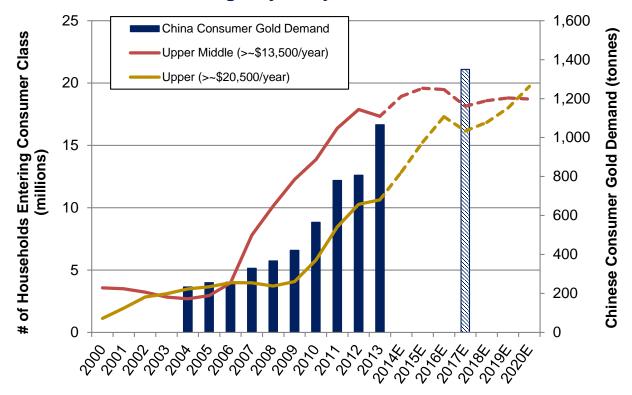

- 1st entering <u>Middle Class</u> (income > ~\$8K/year): Increased spending on housing, cell phones, mass produced clothing
- 1st entering <u>Upper Middle Class</u> (income > ~\$13.5K/year): Increased spending on cars and non-essential items
- 1st entering <u>Upper Class</u> (income > ~\$20.5K/year): Increased spending on health care, tourism, non-essential items

Source: GaveKal Research

Chinese trends support bullish gold outlook

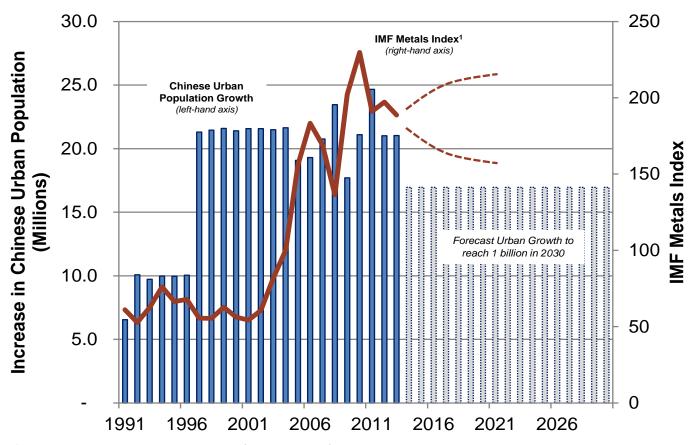

Chinese household wealth and gold jewelry, bar and coin demand

- · Growing household wealth driving higher levels of disposable income
- China now largest market for gold demand (~1,100 tonnes or ~35M ounces in 2013)
- The World Gold Council anticipates that demand will increase to at least 1,350 tonnes or to ~43M ounces by 2017 (25%)

Urbanization in China

China's urban population trends and commodity prices

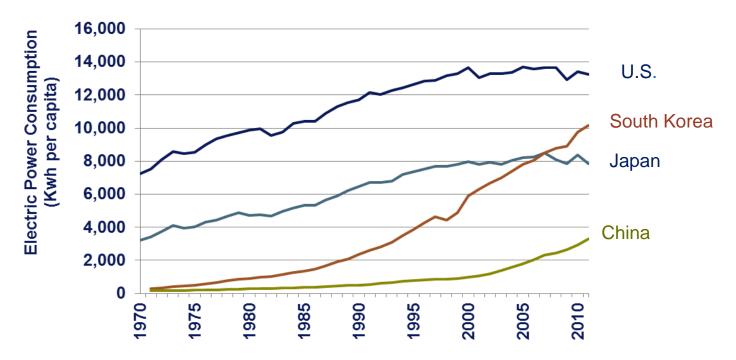

1The IMF Metals Index weightings: Aluminum = 36%; Copper = 26%; Iron Ore = 12%; Nickel = 10%; Zinc = 6%; Uranium = 5%; Tin = 2% and Lead = 2%

- Current 50% urbanization rate expected to exceed 70% by 2030
 - Another ~300M people moving to cities!

Chinese consumption to spur copper demand*

Electric power consumption - China vs. developed world

- China accounts for over 40% of global copper demand (Power sector = 50% of this)
- The average Chinese citizen consumes:
 - ~33% of the amount of electricity a South Korean citizen consumes; and
 - 25% of what the average person in the United States consumes

Status of the commodities cycle

Gold: "Prices subdued through 2017 and then to strengthen"

Near-term: Prices to remain "subdued", but range bound

- Continuing U.S. dollar strength
- Low inflation & higher interest rates to limit investment demand
- Relaxation of import restrictions in India
- Price sensitive Chinese consumers

Longer-term: Macroeconomic and industry trends support higher prices

- Return of inflation (initially with labor markets in U.S., will past QE efforts to catch up?)
- Decreasing mine supply
- Wealth trends in China
 - Development of health care and social safety net programs

Status of the commodities cycle

Copper: "Prices subdued through 2017 and then to strengthen"

<u>Near-term</u>: Moderate supply surplus conditions will weigh on prices

- Advanced stage project additions
- Slowing property sector and SOE reforms in China
- Purchases by China's State Reserve Bureau could provide support

Longer-term: Market fundamentals are bullish

- Decreasing mine supply
- Urbanization trends in China
- Consumption based economic growth (vs. investment) in China

Status of the commodities cycle

Oil: "Market restructuring"

Near-term: Supply driven bear market (is \$50/barrel a floor or ceiling?)

- How the global market restructures will determine prices
 - Competitive: marginal cost of non-OPEC producers will determine prices
 - OPEC as an effective cartel: lower output will drive prices relatively higher
- Building inventory overhang
- Stronger global demand (lagged response to price decrease)

Longer-term: Markets to normalize

- Capex reductions will slow supply growth (OPEC and non-OPEC)
- China and India demand growth

...Finally...to Set Expectations...

Newmont's Economist?

"...He Sucks!..."

Tom.Brady@newmont.com

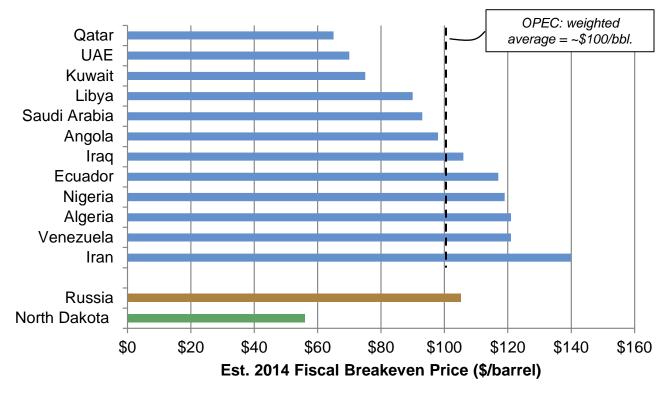

Appendix

Newmont's worldwide portfolio

Oil price stretches budgets of many OPEC members

2014E fiscal breakeven prices (\$/barrel)*

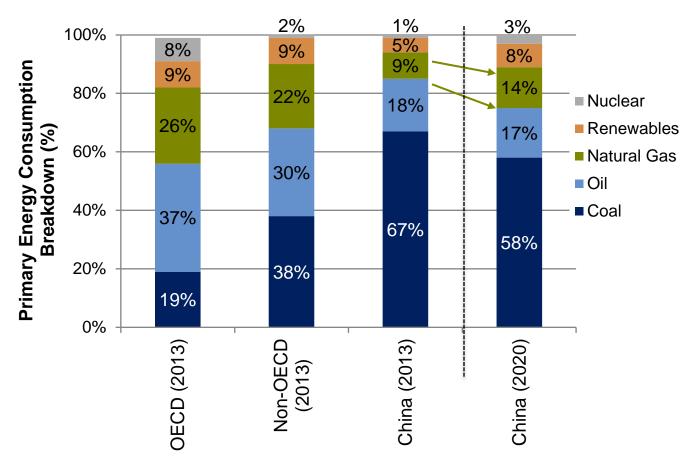

- Brent crude price (Nov. 20th, 2014) = ~\$79/barrel (...~\$71 on Dec. 2...~\$51, currently)
- Most U.S. shale projects continue to be profitable below \$80/barrel
 - Bakken and Eagle Ford formations profitable at \$50/barrel

^{*}Source: Wall Street Journal, Bloomberg, Oxford Economics

Natural gas importance will grow for China

Primary energy consumption breakdown (%)*

- China's energy mix is highly dependent on coal (nearly 70%)
- Natural gas will play a more important role going forward

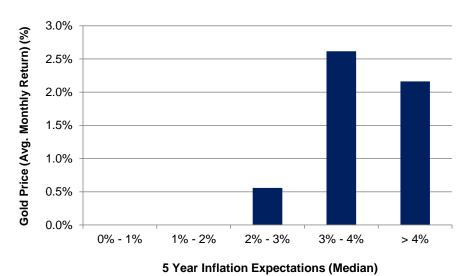

^{*}Source: Goldman Sachs

Gold positively correlated with inflation

Gold price returns & current inflation

0.6% 0.5% 0.4% 0.4% 0.3% 0.2% 0.2% 0.1% 0.0% - 1% 1% - 2% 2% - 3% 3% - 4% > 4% Concurrent Inflation Expectations (U.S. CPI %)

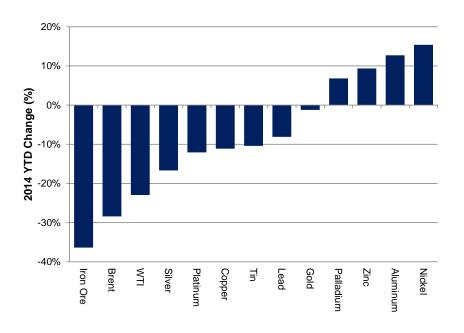

Gold price returns & expected inflation

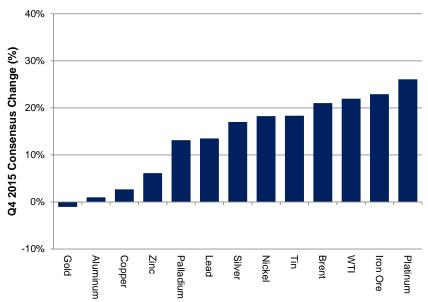

- Gold prices tend to increase with higher current and expected inflation
 - Expected inflation appears to drive gold more than current
